ABSTRACT: The main goal of this paper is to demonstrate that, contrary to Rothstein’s (1999) assertions, data from European Portuguese support the idea that the count / mass distinction shows up in different grammatical domains besides the nominal one. After a brief survey of the properties underlying the count / mass distinction, we present and discuss Rothstein’s main proposals, observing that, in EP, the opposition under analysis plays an important role at the verbal and adjectival domains. Finally, we pay special attention to predicative adjectives, concluding that the count / mass distinction can be taken to describe adequately some of their semantic characteristics. We propose a classification of adjectives into count, mass and indeterminate ones, according to their behaviour relative to quantifying and temporal locating adverbials.
